Motivation

Assignment Project Exam Help

- Beta reduction in Miranda can cause h
- Similar effects in Java
- Fixed heap size – limited resources
- How do we reuse (recycle) memory?

<https://eduassistpro.github.io/>

am graph

Motivation

- We need to :
 - ▶ Find which cells are no longer required by the program
 - ▶ Make those cells available to the me
- Unreferenced cells are called GARB
- Key technique : “GARBAGE COLLECTION”
- Three popular variants :
 - ▶ Mark-scan
 - ▶ Two-space (or “semi-space”) copying
 - ▶ Reference counting

1. Mark-scan

- Triggered when program has used $> 80\%$ of heap
- Evaluation suspended until collect
- May happen many times during program
- Mark :
 - ▶ Follow pointers from root cell of program and mark all reachable
- Scan :
 - ▶ All cells in the heap
 - ★ if marked, set mark bit to 0 (ready for next mark)
 - ★ else attach cell to free list

1. Mark-scan

Assignment Project Exam Help

- Mark-scan uses a FREE LIST for alloc
 - ▶ A linked list of cells which are available
 - ▶ Before program starts, ALL cells are in the free list
 - ★ Then program is loaded
 - ★ Then program is run
 - ▶ Scanner re-creates the free list by linking all unused cells
 - ▶ Cells are unlinked from free list when allocated

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

2. Two-space copying

- The two-space collector must :
 - ▶ Follow pointers from the root cell of t
 - ▶ update any pointers to that cell so the
 - ▶ Swap the names/roles of FROM-
 - ▶ Allow evaluation to proceed
 - Garbage is “left behind” after copying
 - Allocation is by simple (fast) pointer-increment
- o TO-space and

3. Reference Counting

Assignment Project Exam Help

- Each cell is extended with a reference count
- The reference count keeps track of how many pointers point to the cell
 - ▶ Each new pointer to this cell causes its reference count to be incremented
 - ▶ Each deletion of a pointer to this cell causes its reference count to be decremented
- Any cell with a reference count of 0 is garbage.
- All cells with reference count 0 are on FREE LIST

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

Comparison

- Overheads :

- ▶ iMark-scan :

- ★ 1 bit per cell
 - ★ + a stack for

- ▶ Copying :

- ★ 100% space overhead

- ▶ Reference count :

- ★ typically 32 bits per cell
 - ★ + time overhead (when copy/delete pointer, must also read in and modify the cell it points to!)

Add WeChat edu_assist_pro

Comparison

- Compaction/fragmentation
 - ▶ Mark-scan :
 - ★ Must run separate compactor
 - ▶ Copying :
 - ★ Inherently compacting
 - ★ No fragmentation immediately after copy (BUT remember)
 - ▶ Reference counting :
 - ★ Must run separate compactor to reduce fragmentation

Add WeChat edu_assist_pro

Comparison

- Small program in big heap :
 - ▶ Mark-scan : visits ALL heap cells (slow)
 - ▶ Copying : only visits program cells (fast)
 - ▶ Reference count : only visits cells in use (fast)
- Large program (nearly fills heap)
 - ▶ Mark-scan : performance degrades
 - ▶ Copying : performance degrades
 - ▶ Reference count : unaffected

Comparison

Assignment Project Exam Help

- Cyclic structures in heap : <https://eduassistpro.github.io/>
 - ▶ Mark-scan : unaffected
 - ▶ Copying : unaffected
 - ▶ Reference count : needs special attention !
